

JUDICIAL COUNCIL OF CALIFORNIA

Administrative Office of the Courts

TO: Presiding Judges and Court Executive Officers\ [0.5em] **FROM:** Research, Analytics, and Data Unit\ [0.5em] **DATE:** June 29, 2026\ [0.5em] **RE:** Jury Data Report, Fiscal Year 2024-25\ [0.5em]

Executive Summary

Figure 1: Key Performance Indicators for FY 2024-25

In FY 2024-25, approximately 11,812,452 individuals were potentially available for jury service statewide. Of these, 5,209,750 were qualified and available, producing a juror yield of **44.1%** (-0.9 pp from prior year). Juror utilization stands at **7.9%**, with 102,430 jurors ultimately sworn across 7,253 jury trials.

Both metrics remain below NCSC-recommended targets (50% yield, 73% utilization), indicating continued opportunities to optimize jury operations statewide.

Background

The Jury Data Report (JDR) tracks jury administration metrics across California’s 58 trial courts. Performance is measured against standards from the National Center for State Courts’ CourTools framework, which defines two primary indicators:

Juror Yield measures the efficiency of summoning—the proportion of prospective jurors who are qualified and available to serve. **Juror Utilization** measures how effectively those qualified jurors are actually used in jury selection.

The Juror Funnel

Each stage shows cumulative attrition from initial summonses

Juror Yield Analysis

Figure 3: Juror Yield Trend (FY 2007-2025)

Figure 4: Yield Decomposition: Where Do Summonses Go?

The yield decomposition reveals that **Failure to Appear (25.7%)** and **Excused jurors (8.7%)** represent the largest sources of attrition. Per CourTools guidance, courts with high FTA rates may benefit from stricter summons enforcement, while high excuse rates warrant review of excuse policies and service burden reduction.

Juror Utilization Analysis

Juror utilization comprises three components, each with a 90% target. The combined target is 73% ($0.90 \times 0.90 \times 0.90$).

Data Confidence

Data quality is assessed through submission completeness and internal consistency checks using Average Absolute Percent Error (AAPE).

Court Submission Rate: 100%

58 of 58 courts submitted data for FY 2024–25

Figure 8: Court Data Submission Status

Average Absolute Percent Error by Metric

Lower values indicate better consistency between reported totals and subcategory sums

Figure 9: Data Consistency: AAPE by Metric Category

Overall data confidence is estimated at **-Inf%**, based on an average AAPE of **Inf%** across consistency metrics. This falls below the recommended 95% confidence threshold.

Path Forward

The data reveal several areas where courts may focus efforts to improve jury operations:

Yield Enhancement Opportunities Courts experiencing high failure-to-appear rates may benefit from evaluating summons enforcement procedures. Those with elevated undeliverable rates should examine source list accuracy. High excuse rates warrant review of excuse-granting policies and exploration of service burden reduction measures such as shorter terms or improved amenities.

Utilization Optimization Opportunities Low panel utilization rates suggest panel sizes exceed selection needs and may be reduced. Underperformance in the percentage sent for selection often stems from day-of-trial cancellations; improved pretrial management can help ensure scheduled trials proceed. The percentage told to report reflects forecasting precision—courts consistently over-summoning should adjust summons volumes based on historical yield patterns.

Data Quality Enhancement Continued focus on consistent coding practices, timely submissions, and data governance will improve confidence in statewide metrics and enable more reliable forecasting.

The Jury Improvement Program remains available to provide operational assessments and technical assistance.

Contact

For questions regarding the JDR or jury-related issues, please contact the Jury Improvement Program.
